# Rank-aware Clustering of Relational Data: Organizing Search Results 

Petr Krajča

## (iv)

DEPARTMENT OF COMPUTER SCIENCE PALACKÝ UNIVERSITY, OLOMOUC

## Motivation

- applications of similarity-based databases
- improving user experience

| $\#$ | Score | City | Price | Bdrms | SqFeet | Porch |
| :--- | :--- | :--- | ---: | ---: | ---: | :---: |
| 1 | 1.000 | Roseville | 327,000 | 5 | 3,856 | Y |
| 2 | 0.850 | Roseville | 321,900 | 5 | 4,460 | Y |
| 3 | 0.560 | Elmwood | 290,000 | 5 | 2,933 | N |
| 4 | 0.560 | West End | 292,000 | 3 | 2,945 | Y |
| 5 | 0.560 | Roseville | 295,900 | 5 | 3,820 | Y |
| 6 | 0.325 | West End | 299,900 | 3 | 2,810 | N |
| 7 | 0.275 | Roseville | 181,500 | 4 | 2,562 | Y |

## Issues

- users overwhelmed with similar items
- items with similar relevance (score) mixed up (unintuitive order)
- lack of insight into result ordering

## Proposed Solution

■ based on formal concepts analysis (FCA)

## Outline of the Algorithm

1 convert input data into a form suitable for FCA
2 identify formal concepts (clusters)
3 from these concepts pick the most interesting ones from the user's viewpoint

## Remarks

■ FCA: well-established framework (theory, algorithms, applications)

- connection to psychology of concepts
- need to preserve order given by the scoring function

## Formal Concept Analysis (1 of 3)

- method of tabular data analysis (R. Wille, TU Darmstadt)

■ used for data mining, knowledge discovery, data preprocessing

## Input

■ table-rows $=$ objects, columns $=$ attributes (features), $\times$ indicates that particular object has particular attribute

|  | $a_{1}$ | $a_{2}$ | $a_{3}$ | $a_{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| $o_{1}$ | $\times$ | $\times$ |  | $\times$ |
| $o_{2}$ | $\times$ |  | $\times$ |  |
| $o_{3}$ |  | $\times$ | $\times$ | $\times$ |
| $o_{4}$ | $\times$ | $\times$ | $\times$ | $\times$ |

## Output

- all maximal submatrices full of $\times$ 's present in table

■ these submatrices are natural concepts hidden in the data

- form a hierarchy

## Formal Concept Analysis (2 of 3)

A formal context is a triplet $\langle X, Y, I\rangle$, where $X$ and $Y$ are non-empty sets and $I \subseteq X \times Y$.

- $X \ldots$. set of objects

■ Y . . . set of attributes
$■\langle x, y\rangle \in I \ldots$ object $x$ has attribute $y$ )

## Concept-forming operators

For a formal context $\langle X, Y, I\rangle$, operators ${ }^{\uparrow}: 2^{X} \rightarrow 2^{Y}$ and ${ }^{\downarrow}: 2^{Y} \rightarrow 2^{X}$ are defined for every $A \subseteq X$ and $B \subseteq Y$ by:

$$
\begin{aligned}
& A^{\uparrow}=\{y \in Y \mid \text { for each } x \in A: \quad\langle x, y\rangle \in I\} \\
& B^{\downarrow}=\{x \in X \mid \text { for each } y \in B:\langle x, y\rangle \in I\}
\end{aligned}
$$

- $A^{\uparrow} \ldots$ set of all attributes shared by all objects from A
- $B^{\downarrow} \ldots$ set of all objects sharing all attributes from B

## Formal Concept Analysis (3 of 3)

A formal concept in $\langle X, Y, I\rangle$ is a pair $\langle A, B\rangle$ of $A \subseteq X$ and $B \subseteq Y$ such that

$$
A^{\uparrow}=B \text { and } B^{\downarrow}=A .
$$

- $A$... extent of $\langle A, B\rangle$
- $B \ldots$ intent of $\langle A, B\rangle$
- $\langle A, B\rangle$ is a formal concept iff $A$ contains just objects sharing all attributes from $B$ and $B$ contains just attributes shared by all objects from $A$.

## Formal Concept Analysis (Example)

|  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| dog | $\times$ |  | $\times$ |  | $\times$ |
| cod | $\times$ | $\times$ |  |  | $\times$ |
| frog | $\times$ | $\times$ | $\times$ |  | $\times$ |
| bean | $\times$ |  | $\times$ | $\times$ |  |
| daffodil | $\times$ |  | $\times$ | $\times$ |  |
| waterlily | $\times$ | $\times$ |  | $\times$ |  |

$$
\{\operatorname{dog}, \operatorname{cod}, f r o g\}^{\uparrow}=\{\text { needs water, can move around }\}
$$

$\{\text { needs water, can move around }\}^{\downarrow}=\{$ dog, cod, frog $\}$
$\langle\{$ dog, cod, frog $\},\{$ needs water, can move around $\}\rangle \Longrightarrow$ animal

## Subconcept-superconcept Hierarchy

- partial order $\leq$

$$
\left\langle A_{1}, B_{1}\right\rangle \leq\left\langle A_{2}, B_{2}\right\rangle \text { iff } A_{1} \subseteq A_{2} \text { (or, equivalently, iff } B_{2} \subseteq B_{1} \text { ). }
$$

■ set of formal concepts $\mathcal{B}(X, Y, I)$ together with $\leq$ form a complete lattice (concept lattice).

## Natural interpretation

- animal: 〈\{dog, cod, frog\}, \{needs water, can move around\}〉
- dog: $\langle\{\operatorname{dog}\},\{$ needs water, lives on land, can move around $\}\rangle$
- $\operatorname{dog} \leq$ animal, this means:
- dog - more specific concept
- animal - more general concept

## Input Data

- ranked data table

■ $\mathbb{Y}=\left\{y_{1}, \ldots, y_{n}\right\}$ finite number of columns (attributes)

- each attribute has its domain $D_{y}$ (set of permitted values)

■ Cartesian product of domains, denoted by $\prod_{y \in \mathbb{Y}} D_{y}$, is a set of all maps

$$
t: \mathbb{Y} \rightarrow \bigcup_{y \in \mathbb{Y}} D_{y}
$$

such that $t(y) \in D_{y}$ for all $y \in \mathbb{Y}$.

- data table is any finite subset $\mathcal{D} \subseteq \prod_{y \in \mathbb{Y}} D_{y}$.
- $\mathcal{D}$ is a set of tuples (no inherent order of tuples)

■ let $\langle\mathbb{S}, \leq\rangle$ be a poset, map $s_{\mathcal{D}}$

$$
s_{\mathcal{D}}: \mathcal{D} \rightarrow \mathbb{S}
$$

describes relevance of tuples in the data table (scoring function)

## Data Preparation (1 of 2)

- conceptual scaling is a process transforming general data table $\mathcal{D}$ into a formal context $\langle X, Y, I\rangle$
- replacing ordinal attributes with nominal ones (e.g., with equidistant intervals)

■ e.g.: $D_{\text {price }}$ may be replaced with intervals $\{\ldots,[280,000 ; 290,000)$, $[290,000 ; 300,000), \ldots\}$

■ $X=\{1, \ldots, n\}$ where each $x \in X$ corresponds to one row $t$ in the data table and numbers are assigned to rows in the descending order w.r.t. $s_{\mathcal{D}}$
$■ Y=\left\{\langle y, v\rangle \mid\langle y, v\rangle \in \bigcup_{t_{i} \in \mathcal{D}} t_{i}\right\}$, i.e., all attribute value pairs in the data table $\mathcal{D}$
■ $I=\left\{\langle i,\langle y, v\rangle\rangle \mid\right.$ for every $t_{i} \in \mathcal{D}$ and $y \in Y$ iff $\left.t_{i}(y)=v\right\}$ (object $i$ has an attribute $\langle y, v\rangle$, iff the value of the attribute $y$ of row $t_{i}$ is equal to $v$ )

## Data Preparation (2 of 2)

- map $r: X \rightarrow \mathbb{N}$ assigns to each tuple numerical rank such that for every two tuples $t_{i}, t_{j} \in \mathcal{D}$ and corresponding objects $x_{i}, x_{j} \in X$,

$$
s_{\mathcal{D}}\left(x_{i}\right) \leq s_{\mathcal{D}}\left(x_{j}\right) \text { implies } r\left(x_{j}\right) \leq r\left(x_{i}\right)
$$

- $r$ and $\leq$ provides comparative meaning
- $r\left(x_{i}\right) \leq r\left(x_{j}\right)$ means object $x_{i}$ is more or equally relevant than $x_{j}$

## Formal Context for Our Running Example

| $x$ | $r(x)$ | $\langle\text { City, Roseville }\rangle$ | 〈poomulg ‘ $\kappa$ ? ? , ○〉 |  |  | $\begin{aligned} & \hat{3} \\ & \frac{2}{2} \\ & \stackrel{3}{0} \\ & \stackrel{0}{2} \end{aligned}$ | $\begin{aligned} & \text { s. } \\ & 0 \\ & 0 \\ & \stackrel{0}{0} \\ & \stackrel{y}{0} \end{aligned}$ | $\begin{aligned} & \text { on } \\ & \text { n } \\ & \text { sis } \\ & 0 \end{aligned}$ | $\begin{aligned} & \widehat{\text { In}} \\ & \text { ng } \\ & \text { sis } \end{aligned}$ |  |  |  |  |  |  | z su E E |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | $\times$ |  |  | $\times$ |  |  |  |  | $\times$ |  |  | $\times$ |  |  |  |
| 2 | 2 | $\times$ |  |  | $\times$ |  |  |  |  | $\times$ |  |  |  | $\times$ |  |  |
| 3 | 5 |  | $\times$ |  |  | $\times$ |  |  |  | $\times$ |  | $\times$ |  |  |  | $\times$ |
| 4 | 5 |  |  | $\times$ |  | $\times$ |  | $\times$ |  |  |  | $\times$ |  |  |  |  |
| 5 | 5 | $\times$ |  |  |  | $\times$ |  |  |  | $\times$ |  |  | $\times$ |  |  |  |
| 6 | 6 |  |  | $\times$ |  | $\times$ |  | $\times$ |  |  |  | $\times$ |  |  |  | $\times$ |
| 7 | 7 | $\times$ |  |  |  |  | $\times$ |  | $\times$ |  | $\times$ |  |  |  |  |  |

Algorithm: Idea (1 of 2)
■ each formal concept $\langle A, B\rangle$ identifies set of objects $A$ having common attributes $B$
■ set of attributes $B$ unambiguously describes set of objects $A$

- attributes from $B$ can serve as description (labels) for objects from $A$

■ interested in formal concepts creating continuous sequence w.r.t. a ranking function

Formal concept $\langle A, B\rangle$ shall be called continuous formal concept w.r.t. a ranking function $r$ iff there is no object $x \notin A$ such that

$$
\min _{i \in A}(r(i))<r(x)<\max _{i \in A}(r(i))
$$

## Algorithm: Idea (2 of 2)

■ enumerating continuous formal concepts recursively in lexicographical order $\prec$
■ e.g., $\langle\{1,2\}, \ldots\rangle \prec\langle\{1,2,3\}, \ldots\rangle \prec\langle\{1,3\}, \ldots\rangle$
■ recursive algorithm

- each invocation extends input formal concept with one object
- whenever is the new concept lexigraphically smaller, the given branch of computation can be abandoned
- variant of the Kuznetsov's Close-by-One (CbO) algorithm

■ extension enumerating only continuous formal concepts (pruning)

## Algorithm: Pseudocode

1 Procedure Generate $(\langle A, B\rangle, x)$
2 result $=\{\langle A, B\rangle\}$;
$3 \quad$ foreach $i$ in $X-A$ do
if $(i \geq x)$ and $((A \neq \emptyset)$ and $(r(i) \leq \operatorname{MaxRANK}(A, x)))$ then
$D=B \cap\{i\}^{\uparrow}$;
$C=D^{\downarrow}$;
skip $=$ false;
foreach $j$ in $C$ do
if $((j<i) \wedge(j \notin A))$ then
skip = true;
break loop;
if not skip and IsContinuous $(C, i)$ then result $=$ result $\cup$ GENERATE $(\langle C, D\rangle, i)$;
return result;
Algorithm 1: Procedure computing all continuous formal concepts

## Are All Concepts Equal?

- large number of formal concepts hidden in the data
- not all continuous
- still large number (18 in our examples)
- some of low importance, e.g.:
- covering single object
- covering single attribute $\langle\{1,2,3,5\},\{\langle B d r m s, 5\rangle\}\rangle$

## What Is It?

(a) a transport vehicle
(b) a car
(c) a 2011 Ford Mondeo

LX Hatchback

```
In sentence
(a) I always go to work by transport vehicle
(b) I always go to work by car
(c) I always oo to work by 2011 Ford Mondeo LX Hatchback
```

## What Is It?

(a) a transport vehicle
(b) a car
(c) a 2011 Ford Mondeo LX Hatchback

```
In sentence
(a) I always go to work by transport vehicle
(b) I always go to work by car
(c) I always oo to work by 2011 Ford Mondeo LX Hatchback
```

## What Is It?

(a) a transport vehicle
(b) a car
(c) a 2011 Ford Mondeo LX Hatchback

In sentence
(a) I always go to work by transport vehicle.
(b) I always go to work by car.
(c) I always go to work by 2011 Ford Mondeo LX Hatchback.

## Basic Level Concepts: Intuition

■ multiple approaches

- we adhere to definition by E. Rosch
- notion of cohesion which is a measure describing similarity among objects in a given formal concept

## Basic Level Concept

(a) $\langle A, B\rangle$ has a high cohesion,
(b) $\langle A, B\rangle$ has a significantly larger cohesion than its upper neighbors,
(c) $\langle A, B\rangle$ has only a slightly smaller cohesion than its lower neighbors.

■ not a yes/no property

## Basic Level Concepts: Formalization (1 of 2)

- approach based on fuzzy logic in the narrow sense (proposed by Belohlavek and Trnecka)

## Cohesion

- an average bitwise similarity of all objects of a formal concept

$$
\operatorname{coh}(\langle A, B\rangle)=\frac{\sum_{x_{1}, x_{2} \in A, x_{1}>x_{2}} \operatorname{sim}\left(x_{1}, x_{2}\right)}{|A| \cdot(|A|-1) / 2}
$$

■ where $\operatorname{sim}\left(x_{1}, x_{2}\right)$ is similarity of two objects, i.e., a ratio of attributes both concepts have in common to the total number of attributes

$$
\operatorname{sim}\left(x_{1}, x_{2}\right)=\frac{\left|\left\{x_{1}\right\}^{\uparrow} \cap\left\{x_{2}\right\}^{\uparrow}\right|}{|\mathbb{Y}|]}
$$

## Example: Continuous Formal Concepts and Cohesion

## Basic Level Concepts: Formalization (2 of 2)

- formalization of properties proposed by Rosch

$$
B L(c)=B L_{a}(c) \cdot B L_{b}(c) \cdot B L_{c}(c)
$$

■ real interval $[0,1]$ as a scale of truth degrees

- multiplication corresponds to a product t-norm (Goguen)
(a) has a high cohesion ...coh(c)
(b) has a significantly larger cohesion than its UN's $\ldots 1-\frac{\operatorname{coh}\left(c_{u}\right)}{\operatorname{coh}(c)}$ where $c_{u}$ is an UN
(c) has only a slightly smaller cohesion than its LN's $\ldots \frac{\operatorname{coh(c)}\left(\operatorname{coh}\left(c_{l}\right)\right.}{\text { where } c_{l}}$ is a LN

$$
\begin{aligned}
B L_{a}(c) & =\operatorname{coh}(c) \\
B L_{b}(c) & =\frac{1}{|\mathcal{U N} *(\mathcal{B}, c)|} \cdot \sum_{c_{u} \in \mathcal{U N}^{*}(\mathcal{B}, c)} 1-\frac{\operatorname{coh}\left(c_{u}\right)}{\operatorname{coh}(c)} \\
B L_{c}(c) & =\frac{1}{\left|\mathcal{L N}^{*}(\mathcal{B}, c)\right|} \cdot \sum_{c_{l} \in \mathcal{L N}^{*}(\mathcal{B}, c)} \frac{\operatorname{coh}(c)}{\operatorname{coh}\left(c_{l}\right)}
\end{aligned}
$$

## Results: Numerical Point of View

| objects | $B L_{a}$ | $B L_{b}$ | $B L_{c}$ | $B L$ |
| :--- | ---: | ---: | ---: | ---: |
| $\}$ | 0 | 1 | 0 | 0 |
| $\{1\}$ | 1 | 0.2 | 0 | 0 |
| $\{1,2\}$ | 0.8 | 0.08 | 0.8 | 0.05 |
| $\{1,2,3,5\}$ | 0.5 | 0.31 | 0.68 | 0.11 |
| $\{1,2,3,4,5,6,7\}$ | 0.34 | 0 | 0.59 | 0 |
| $\{\mathbf{1}, \mathbf{2}, \mathbf{5}\}$ | $\mathbf{0 . 7 3}$ | $\mathbf{0 . 3 2}$ | $\mathbf{0 . 8 3}$ | $\mathbf{0 . 1 9}$ |
| $\{2\}$ | 1 | 0.2 | 0 | 0 |
| $\{\mathbf{3}\}$ | $\mathbf{1}$ | $\mathbf{0 . 5}$ | $\mathbf{0}$ | $\mathbf{0}$ |
| $\{3,4,6\}$ | 0.6 | 0.22 | 0.88 | 0.12 |
| $\{3,4,5,6\}$ | 0.47 | 0.27 | 0.78 | 0.1 |
| $\{3,5\}$ | 0.4 | 0 | 0.4 | 0 |
| $\{3,6\}$ | 0.6 | 0 | 0.6 | 0 |
| $\{4\}$ | 1 | 0.4 | 0 | 0 |

| Roseville | 181,500 | 4 | 2,562 | Y |

## Conclusions and Future Research

- novel efficient algorithm for organizing search engine results

■ real-world issue
■ takes into account psychology of concepts

- suitable for other applications
- ordinary database query processing
- document search engines

■ large scale evaluation (incl. A/B testing)
